AST Technology Introduces System Moulding™

New Program Provides a Structured Approach to Injection Moulding Success

Germany, UK, USA – AST Technology, a PCIC Group Company specialising in comprehensive support services to the injection moulding industry, announces the release of its new System Moulding program designed to provide moulders/OEMs with a structured approach to injection moulding.

System Moulding is available in three modules to suit customer requirements:

- Module 1 : Mould proving
- Module 2: Process optimisation
- Module 3: Tolerancing and control

System Moulding provides an easy-to-use, icon driven user interface and is customisable to incorporate customers' equipment and materials. It enables a fully documented process centrally within a maximised process window to drive higher profitability through improved stability and reduced cycle times.

"We look forward to introducing potential customers to the cost savings that System Moulding can help them achieve on their plastic mouldings," commented AST's Managing Director Philip Parmenter. "This new program is an ideal complement to the newly enhanced CVe Version 2 and CVe Live that is also being introduced to offer moulders and OEMs a higher level of mould monitoring capability."
